

FRONTEND STRUCTURE AND RULES

PROJECT STRUCTURE (MANDATORY)

```
lib/
|
├─ main.dart
├─ app.dart
|
├─ core/
|   ├── network/      # API setup (ONLY assigned person edits)
|   ├── navigation/   # routes (CONTROLLED edits)
|   └─ theme/
|
├─ features/
|   ├── auth/         # Kwabena
|   ├── client/       # Nhyira
|   └─ worker/        # Peniel
|
└─ shared/            # Kwabena (UI components only)
    └─ widgets/
```

FEATURE STRUCTURE (SAME FOR EVERYONE)

Each feature of all the three of us MUST follow this:

```
feature_name/
└─ presentation/
    ├── screens/
    └─ widgets/  (only if needed, that is if it is needed in your screen.
                  Widgets are actually like components of a screen you are working on that
                  you will be re using, like a button)
```

Example (CLIENT)

```
client/
└─ presentation/
    ├── screens/
    │   ├── client_home_screen.dart
    │   ├── explore_artisans_screen.dart
    │   └─ map_discovery_screen.dart
```

```
|   └─ artisan_profile_screen.dart
|
└─ widgets/
    ├── artisan_card.dart
    └─ category_chip.dart
```

✓ Example (AUTH)

```
auth/
└─ presentation/
    ├── screens/
    │   ├── login_screen.dart
    │   ├── signup_screen.dart
    │   └─ role_selection_screen.dart
    └─ widgets/
        ├── auth_button.dart
        └─ auth_input.dart
```

✓ Example (WORKER)

```
worker/
└─ presentation/
    ├── screens/
    │   ├── worker_home_screen.dart
    │   ├── job_requests_screen.dart
    │   └─ profile_screen.dart
```

OWNERSHIP RULES (VERY IMPORTANT)

Folder	Owner	Rule
auth/	Kwabena	Only they edit
client/	Nhyira	Only they edit
worker/	Peniel	Only they edit
shared/	Kwabena	Everyone can use, only owner edits

Folder	Owner	Rule
core/	Will be assigned if any team mate needs it	Controlled edits only

GIT WORKFLOW (STRICT)

NEVER:

- Push directly to `main`
- Edit someone else's feature folder

ALWAYS USE BRANCHES

Each teammate:

```
git checkout -b feature/auth-ui
git checkout -b feature/client-ui
git checkout -b feature/worker-ui
```

DAILY WORKFLOW

1. Update your local project

```
git checkout main
git pull origin main
```

2. Switch to your branch

```
git checkout feature/client-ui
```

3. Sync with main

```
git merge main
```

4. Work → Commit

```
git add .  
git commit -m "feat(client): add explore artisans screen"
```

5. Push

```
git push origin feature/client-ui
```

6. Open Pull Request → Merge to `main`

ROUTING CONTROL (TO PREVENT CONFLICTS)

Only ONE person should edit this file (Nhyira)

Create:

```
core/navigation/app_routes.dart
```

```
class AppRoutes {  
  static const clientHome = '/client-home';  
  static const login = '/login';  
}
```

SHARED COMPONENT RULES

Inside:

```
shared/widgets/
```

ONLY put:

- reusable buttons
 - reusable cards
 - loaders
-

⚠️ **RULE:**

- Don't duplicate UI components across features
 - If reused → move to `shared/`
-

COMMON MISTAKES (AVOID)

- ✗ Editing `app.dart` at the same time
 - ✗ Different folder structures per person
 - ✗ Copy-paste widgets instead of sharing
 - ✗ Not pulling before pushing
-

FINAL TEAM RULE

👉 “You own your feature. Don't touch others. Sync before push.”
